

Watershed Restoration

Most of our habitat restoration efforts are designed to restore aquatic habitats that have been altered by some type of past land management activity. Riparian area and stream corridor restoration activities have included bank stabilization, reestablishment of riparian vegetation, pool habitat formation, and woody debris introductions. Watershed restoration activities designed to reduce sediment delivery to area streams from forest trails and roads and to make stream crossings Aquatic Organism Passable (AOP) are also a major component of our habitat restoration program.
